EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

Introduction

This Programme is funded by the European Unions (EU) & implemented by

GOPA
WORLDWIDE CONSULTANTS

AFC!
AGRICULTURE & FINANCE
CONSULTANTS

JVL CONSULTING
GRUPE ARTURA

Workshop overview

- Installing R and RStudio
- GitHub and R in the cloud
- Using R for
 - Calculator
 - Statistics
 - Data depiction with graphs and maps
 - Simulate data (Risk analysis)
 - Reporting using Rmarkdown
- Other software – qGIS for clean maps

Workshop structure

1. Installing R and RStudio
2. GitHub and working in the cloud
3. Introduction to R
 1. General
 1. Using functions
 2. Apply functions
4. Basic statistics
5. Frequency measures
6. Measures of association
7. Spatial data analysis
8. RMarkdown and reporting from R
9. Diagnostic test analysis

Available files

1. Full folder of all code and data for analysis – but we will be using GitHub to access this but in case there are issues you can use this directly
2. Tutorial videos where applicable
3. Software
 1. R
 2. RStudio
 3. Git for Windows
 4. qGIS

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

1. Installing R and RStudio

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

- **R and RStudio can be installed from online** at <https://cloud.r-project.org/> and <https://www.rstudio.com/products/rstudio/download/preview/> respectively but the software downloads are available in the software folder for the workshop - R-4.2.0-win.exe and RStudio-2022.02.1-461.exe respectively

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

2. GitHub and working in the cloud

Install GIT on your computer

software files: Git-2.36.0-64-bit

or <https://git-for-windows.github.io/>

- Adjusting your PATH environment
 - *SELECT Git from the command line and also from 3rd-party software*
- RStudio for Windows prefers for Git to be installed below C:/Program Files and this appears to be the default

Theme 1: Introduction - R; Vectors, Matrixes, Factors, Lists , Dataframes, Functions

1.1 RStudio and making a project file

- Open and Navigate RStudio
- Open Project made in GitHub workflow
- Open 01_Introduction.R
- Check working directory

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

1.2 Introduction to R

- Run through the
01_Introduction.R file

1.2 Introduction to R

- **Vector**
 - **Make vector of ages of attendees**
 - Name them
 - Summary stats
- **Dataframe (I 188)**
 - Create a dataframe based on the subset of `wahid_species` where the total number of cases are more than 10 AND the species is 'Cattle'

1.2 Introduction to R

- **Basic**
 - 1. create a vector of numbers of every even number between 2 and 20
 - 2. establish the square root of the sum of your number vector
 - 3. Create a vector of numbers between 1 and 50 (hint: use the : operator `c(1:50)`)
 - 4. Create a matrix
- **Intermediate**
 - Use the sample function inbuilt in R to sample 10 numbers from the numbered vector in 3 above. hint: use the **?sample** command to take a look at the sample function

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

**Commit and Push any changes
or comments you have to your
GitHub repository**

- **Vectors (one dimensional array):** can hold numeric, character or logical values.
 - All elements same data type
- **Matrices (two dimensional array):** can hold numeric, character or logical values.
 - All elements same data type
- **Data frames (two-dimensional objects):** can hold numeric, character or logical values.
 - Within each column the data-type is the same

1.2 Introduction to R

- **Basic**
 - 1. create a vector of numbers of every even number between 1 and 20
 - 2. establish the square root of the sum of your number vector
 - 3. Create a vector of numbers between 1 and 50 (hint: use the : operator c(1:50))
 - 4. Create a matrix
- **Intermediate**
 - Use the sample function inbuilt in R to sample 10 numbers from the numbered vector in 3 above. hint: use the **?sample** command to take a look at the sample function

Seroprevalence of foot-and-mouth disease virus in cattle herds raised in Maasai Mara ecosystem in Kenya

Daniel Nthiwa^{a,b,*}, Bernard Bett^b, David Odongo^c, Eucharia Kenya^a, Martin Wainaina^b, Santina Grazioli^d, Efreem Foglia^d, Emiliana Brocchi^d, Silvia Alonso^e

ABSTRACT

A cross-sectional study was carried out to determine foot-and-mouth disease (FMD) seroprevalence and identify risk factors of exposure among cattle herds raised in three zones with different types of land use and progressively distant from the Maasai Mara National Reserve (MMNR) boundary. We selected five villages purposively; two in zone 1 (area < 20 km from the MMNR), another two in zone 2 (area between 20 – 40 km away from the MMNR) and one in zone 3 (area > 40 km away from the MMNR). A total of 1170 cattle sera were collected from 390 herds in all the zones and tested for antibodies against the non-structural proteins (NSPs) of FMD virus (FMDV) using two 3ABC-based Enzyme-Linked Immunosorbent Assay ELISA kits. All sera samples were also screened for serotype-specific antibodies using Solid Phase Competitive ELISA (SPCE) kits (IZSLER, Italy). We targeted FMDV serotypes A, O, South African Territory [SAT] 1 and SAT 2, known to be endemic in East Africa including Kenya. Data on putative risk factors for FMD seropositivity in cattle were collected using a questionnaire. The overall apparent animal-level FMD seroprevalence based on the parallel comparison of the two anti-NSPs ELISA kits was 83.8 % (95 % CI; 81.8–85.9), and differed significantly across zones. Zone 1 had a higher seroprevalence than zones 2 and 3 ($\chi^2 = 116.1$, $df = 2$, $p < 0.001$). In decreasing order, the overall seroprevalences of FMDV serotypes A, SAT 2, O and SAT 1 were 26.3 % (95 % CI; 23.5–29.2), 21.4 % (95 % CI; 18.8–24.0), 21.2 % (95 % CI; 18.7–23.9) and 13.1 % (95 % CI; 11.1–15.3), respectively. The distribution of these serotypes differed significantly between zones ($p < 0.05$) except for SAT 2 serotype ($\chi^2 = 0.90$, $df = 2$, $p = 0.639$). Both serotypes A and O were more prevalent in zones 1 and 2 than zone 3 while serotype SAT 1, was higher in zone 3 compared to other zones. The results of multivariable analyses identified animal sex (i.e., female), raising of cattle in zones 1 and 2 (areas < 40 km away from the MMNR); mixing of cattle from multiple herds at watering points, and pastoral husbandry practices, as significant predictors of animal-level FMD ser-

3.1 Results

- Total tested
- Sex proportions
- Total herds tested
- Apparent prevalence with confidence intervals

3. Results

3.1. Anti-NSP antibodies prevalence and distribution

In total 1,170 cattle sera (78.6% female and 21.4% male) from 390 herds were tested for antibodies against NSPs using two ELISA assays. The proportion of sampled herds described as vaccinated at the time of sampling was 44.9 %. The overall apparent animal-level and true seroprevalences of FMD were 83.8 % (95 % CI; 81.5–86.2) and 84.7 % (95 % CI; 82.4–86.9), respectively. The apparent animal-level seroprevalence of FMD differed significantly between locations where animals were kept. Zone 1 had a higher seroprevalence compared to zones 2 and 3 ($\chi^2 = 116.1$, $df = 2$, $p < 0.001$) (Table 1). The spatial distribution of NSP-positive animals in the surveyed zones is shown in Fig. 1. FMD animal-level seroprevalence also differed significantly by sex ($\chi^2 = 14.5$, $df = 1$, $p < 0.001$), with more female animals (86.0 %; 95 % CI; 83.8–88.2) being seropositive than males (76.0 %; 95 % CI; 70.8–81.2) (Table 1). The level of agreement between both ELISA tests was moderate (Cohen's Kappa statistic $k = 0.6$). The diagnostic sensitivity of both ELISA tests differed significantly (McNemar's $\chi^2 = 60.9$, $df = 1$, $p < 0.001$); the PrioCHECK® FMDV NS ELISA test detected more NSP positives, 81.2 % (95 % CI; 78.7–83.7) than the IZSLER in-house 3ABC trapping ELISA, 72.3 % (69.5–75.1).

3.1.4 – Intraclass Correlation

- How strongly do units/animals in the same groups resemble each other
- $[0,1]$
- 0 = perfectly independent
- 1 = perfectly dependent
- Consider diseases like FMD
- Consider diseases like BSE

https://en.wikipedia.org/wiki/Intraclass_correlation

A dot plot showing a dataset with high intraclass correlation. Values from the same group tend to be similar.

A dot plot showing a dataset with low intraclass correlation. There is no tendency for values from the same group to be similar.

3.1.4 – Intraclass Correlation

- Impacts sample size
BECAUSE
 - Impacts outcome of prevalence survey
- 0.1 is pretty low – the outcomes of the study showed an ICC of 0.24
- An increasing ICC (ρ) Rho will increase sample size
- An increase sample size per herd will increase sample size
- In this study the ability to sample so few animals per herd made the ICC impact small

limited in the area. We accounted for design effect due to herd-level clustering of cattle by adjusting the initial sample size using the formula; $n^1 = n(1 + \rho(m-1))$, where n^1 is the adjusted sample size, ρ the intra-cluster (within-herd) correlation coefficient (ICC), and m the number of animals to be sampled in each herd (Dohoo et al., 2012). The study assumed an ICC of 0.1 for FMD and sampled 3 animals (randomly-selected) in each herd. A total of 465 animals (from 155 herds)

3.1.4 Task

- Create a function in R to work out the design effect given a value of ICC (ρ) and the number of animals sampled per herd (m)
- Call the function *deff*

Sample size

$$n' = n(1 + \rho(m - 1))$$

Design effect (DEFF)

$$\frac{n'}{n}$$

$$\text{DEFF} = 1 + \rho(m - 1)$$

Probability

On any given day what's the
probability of either happening?
(i.e. Parallel)

Boosting Botswana's Trade Capacity

$$P_{work} + P_{rain}$$

$$0.95 + 0.5 = 1.45 \dots$$

$$P_{work} + P_{rain} - (P_{work} * P_{rain})$$

$$0.95 + 0.5 - (0.95 \times 0.5)$$

**= 0.975 = 97.5% chance that you
will work or it will rain**

$$Se_{||} = Se_1 + Se_2 - (Se_1 * Se_2)$$

**Bonus: What it's the probability
that it will both rain and you
will work on any given day?**

3.1.4b: Interpreting diagnostic tests in Parallel

1. Sensitivity

$$Se_{||} = Se_1 + Se_2 - (Se_1 * Se_2)$$

NEGATIVE SAMPLE

2. Specificity

3.1.4b: Interpreting diagnostic tests in Parallel

1. Sensitivity

$$Se_{||} = Se_1 + Se_2 - (Se_1 * Se_2)$$

2. Specificity

$$Sp_{||} = Sp_1 * Sp_2$$

testing in parallel
increases sensitivity
but decreases
specificity

3.1.6 Task establish the sex proportions with their 95% confidence intervals

Variable and category	No. tested (n)	FMD
		% NSP prevalence (95 % CI)
Sex		
Male	250	76.0 (70.1–81.8)
Female	920	86.0 (83.5–88.4)

3.1.7 - Prevalence estimates - Botswana context

- Goal - extract all foot-and-mouth disease data
- Assume design effect of 1 (no clustering between sampled herds)
- Plot these prevalence's using ggplot
- Facet these graphs by species

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

Data visualization with ggplot2 :: CHEAT SHEET

3.1.7.2

Basics

ggplot2 is based on the grammar of graphics, the idea that you can build every graph from the same components: a data set, a coordinate system, and geoms—visual marks that represent data points.

To display values, map variables in the data to visual properties of the geom (aesthetics) like size, color, and x and y locations.

Complete the template below to build a graph.

```
ggplot(data = <DATA>) +  
  <GEOM_FUNCTION> (mapping = aes(<MAPPINGS>),  
  stat = <STAT>, position = <POSITION>) +  
  <COORDINATE_FUNCTION> +  
  <FACET_FUNCTION> +  
  <SCALE_FUNCTION> +  
  <THEME_FUNCTION>
```

ggplot(data = mpg, aes(x = cty, y = hwy)) Begins a plot that you finish by adding layers to. Add one geom function per layer.

last_plot() Returns the last plot.

ggsave("plot.png", width = 5, height = 5) Saves last plot as 5" x 5" file named "plot.png" in working directory. Matches file type to file extension.

Aes Common aesthetic values.

color and fill - string ("red", "#RRGGBB")
linetype - integer or string (0 = "blank", 1 = "solid", 2 = "dashed", 3 = "dotted", 4 = "dotteddash", 5 = "longdash", 6 = "twodash")
lineend - string ("round", "butt", or "square")
linejoin - string ("round", "mitre", or "bevel")
size - integer (line width in mm)
shape - integer/shape name or a single character ("a")

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

```
a <- ggplot(economics, aes(date, unemployment))  
b <- ggplot(seals, aes(x = long, y = lat))
```

```
a + geom_blank() and a + expand_limits()  
Ensure limits include values across all plots.  
b + geom_curve(aes(yend = lat + 1,  
xend = long + 1), curvature = 1) - x, xend, y, yend,  
alpha, angle, color, curvature, linetype, size  
a + geom_path(lineend = "butt",  
linejoin = "round", linemitre = 1)  
x, y, alpha, color, group, linetype, size  
a + geom_polygon(aes(alpha = 50)) - x, y, alpha,  
color, fill, group, subgroup, linetype, size  
b + geom_rect(aes(xmin = long, ymin = lat,  
xmax = long + 1, ymax = lat + 1)) - xmin, xmax,  
ymin, ymax, alpha, color, fill, linetype, size  
a + geom_ribbon(aes(ymin = unemployment - 900,  
ymax = unemployment + 900)) - x, ymax, ymin,  
alpha, color, fill, group, linetype, size
```

LINE SEGMENTS

```
common aesthetics: x, y, alpha, color, linetype, size  
b + geom_abline(aes(intercept = 0, slope = 1))  
b + geom_hline(aes(yintercept = lat))  
b + geom_vline(aes(xintercept = long))  
b + geom_segment(aes(yend = lat + 1, xend = long + 1))  
b + geom_spoke(aes(angle = 1:1155, radius = 1))
```

ONE VARIABLE continuous

```
c <- ggplot(mpg, aes(hwy)); c2 <- ggplot(mpg)  
x, y, alpha, color, fill, linetype, size  
c + geom_area(stat = "bin")  
x, y, alpha, color, fill, linetype, size, weight  
c + geom_density(kernel = "gaussian")  
x, y, alpha, color, fill, group, linetype, size, weight  
c + geom_dotplot()  
x, y, alpha, color, fill  
c + geom_freqpoly()  
x, y, alpha, color, group, linetype, size  
c + geom_histogram(binwidth = 5)  
x, y, alpha, color, fill, linetype, size, weight  
c2 + geom_qq(aes(sample = hwy))  
x, y, alpha, color, fill, linetype, size, weight
```

discrete

```
d <- ggplot(mpg, aes(f))  
x, alpha, color, fill, linetype, size, weight
```

TWO VARIABLES

```
both continuous  
e <- ggplot(mpg, aes(cty, hwy))
```

```
e + geom_label(aes(label = cty), nudge_x = 1,  
nudge_y = 1) - x, y, label, alpha, angle, color,  
family, fontface, hjust, lineheight, size, vjust  
e + geom_point()  
x, y, alpha, color, fill, shape, size, stroke  
e + geom_quantile()  
x, y, alpha, color, group, linetype, size, weight  
e + geom_rug(sides = "bl")  
x, y, alpha, color, linetype, size  
e + geom_smooth(method = lm)  
x, y, alpha, color, fill, group, linetype, size, weight  
e + geom_text(aes(label = cty), nudge_x = 1,  
nudge_y = 1) - x, y, label, alpha, angle, color,  
family, fontface, hjust, lineheight, size, vjust
```

one discrete, one continuous

```
f <- ggplot(mpg, aes(class, hwy))  
f + geom_col()  
x, y, alpha, color, fill, group, linetype, size  
f + geom_boxplot()  
x, y, lower, middle, upper, ymax, ymin, alpha,  
color, fill, group, linetype, shape, size, weight  
f + geom_dotplot(binaxis = "y", stackdir = "center")  
x, y, alpha, color, fill, group  
f + geom_violin(scale = "area")  
x, y, alpha, color, fill, group, linetype, size, weight
```

both discrete

```
g <- ggplot(diamonds, aes(cut, color))  
g + geom_count()  
x, y, alpha, color, fill, shape, size, stroke  
g + geom_jitter(height = 2, width = 2)  
x, y, alpha, color, fill, shape, size
```

THREE VARIABLES

```
seals$z <- with(seals, sqrt(delta_long^2 + delta_lat^2)); l <- ggplot(seals, aes(long, lat))
```

```
l + geom_contour(aes(z = z))  
x, y, z, alpha, color, group, linetype, size, weight  
l + geom_contour_filled(aes(fill = z))  
x, y, alpha, color, fill, group, linetype, size, subgroup
```

continuous bivariate distribution

```
h <- geom_bin2d(binwidth = c(0.25, 500))  
x, y, alpha, color, fill, linetype, size, weight  
h + geom_density_2d()  
x, y, alpha, color, group, linetype, size  
h + geom_hex()  
x, y, alpha, color, fill, size
```

continuous function

```
i <- ggplot(economics, aes(date, unemployment))  
i + geom_area()  
x, y, alpha, color, fill, linetype, size  
i + geom_line()  
x, y, alpha, color, group, linetype, size  
i + geom_step(direction = "hv")  
x, y, alpha, color, group, linetype, size
```

visualizing error

```
df <- data.frame(grp = c("A", "B"), fit = 4.5, se = 1.2)  
j <- ggplot(df, aes(grp, fit, ymin = fit - se, ymax = fit + se))  
j + geom_crossbar(fatten = 2) - x, y, ymax,  
ymin, alpha, color, fill, group, linetype, size  
j + geom_errorbar() - x, ymax, ymin,  
alpha, color, group, linetype, size, width  
Also geom_errorbarh().  
j + geom_linerange()  
x, ymin, ymax, alpha, color, group, linetype, size  
j + geom_pointrange() - x, y, ymin, ymax,  
alpha, color, fill, group, linetype, shape, size
```

maps

```
data <- data.frame(murder = USArrests$Murder,  
state = tolower(rownames(USArrests)))  
map <- map_data("state")  
k <- ggplot(data, aes(fill = murder))  
k + geom_map(aes(map_id = state), map = map)  
+ expand_limits(x = map$long, y = map$lat)  
map_id, alpha, color, fill, linetype, size
```

Stats

An alternative way to build a layer.

A stat builds new variables to plot (e.g., count, prop).

Visualize a stat by changing the default stat of a geom function, `geom_bar(stat="count")` or by using a stat function, `stat_count(geom="bar")`, which calls a default `geom` to make a layer (equivalent to a `geom` function). Use `name`, `syntax` to map stat variables to aesthetics.

```
c + stat_bin(bins = 1, boundary = 10)
x, y | count, ..count, ..density, ..ndensity..
c + stat_count(width = 1) x, y | count, ..prop..
c + stat_density(adjust = 1, kernel = "gaussian")
x, y | count, ..density, ..scaled..

e + stat_bin_2d(bins = 30, drop = T)
x, y, fill | count, ..density..
e + stat_bin_hex(bins = 30) x, y, fill | count, ..density..
e + stat_density_2d(contour = TRUE, n = 100)
x, y, color, size | ..level..
e + stat_ellipse(level = 0.95, segments = 51, type = "t")

l + stat_contour(aes(z = z)) x, y, z, order | ..level..
l + stat_summary_hex(aes(z = z), bins = 30, fun = max)
x, y, z, fill | ..value..
l + stat_summary_2d(aes(z = z), bins = 30, fun = mean)
x, y, z, fill | ..value..

f + stat_boxplot(coef = 1.5)
x, y | lower, ..middle, ..upper, ..width, ..ymin, ..ymax..
f + stat_ydensity(kernel = "gaussian", scale = "area") x, y
| density, ..scaled, ..count, ..n, ..violinwidth, ..width..

e + stat_ecdf(n = 40) x, y | ..x, ..y..
e + stat_quantile(quantiles = c(0.1, 0.9),
formula = y ~ log(x), method = "rq") x, y | ..quantile..
e + stat_smooth(method = "lm", formula = y ~ x, se = T,
level = 0.95) x, y | ..se, ..x, ..y, ..ymin, ..ymax..

ggplot() + xlim(-5, 5) + stat_function(fun = dnorm,
n = 20, geom = "point") x, ..y..
ggplot() + stat_qq(aes(sample = 1:100))
x, y, sample | ..sample, ..theoretical..
e + stat_sum() x, y, size | ..n, ..prop..
e + stat_summary(fun.data = "mean_cl_boot")
h + stat_summary_bin(fun = "mean", geom = "bar")
e + stat_identity()
e + stat_unique()
```

Scales

Override defaults with scales package.

Scales map data values to the visual values of an aesthetic. To change a mapping, add a new scale.

GENERAL PURPOSE SCALES

Use with most aesthetics
`scale_*` `continuous()` - Map cont' values to visual ones.
`scale_*` `discrete()` - Map discrete values to visual ones.
`scale_*` `binned()` - Map continuous values to discrete bins.
`scale_*` `identity()` - Use data values as visual ones.
`scale_*` `manual(values = c())` - Map discrete values to manually chosen visual ones.
`scale_*` `date(date_labels = "mm/yy")` - Map date values as dates.
`scale_*` `datetime()` - Map date values as dates.
`scale_*` `date()` - Map date values as dates.
`scale_*` `time()` - Map time values as times.

X & Y LOCATION SCALES

Use with x or y aesthetics (x shown here)
`scale_x_log10()` - Plot x on log10 scale.
`scale_x_reverse()` - Reverse the direction of the x axis.
`scale_x_sqrt()` - Plot x on square root scale.

COLOR AND FILL SCALES (DISCRETE)

```
n + scale_fill_brewer(palette = "Blues")
For palette choices:
RColorBrewer::display.brewer.all()
n + scale_fill_grey(start = 0.2,
end = 0.8, na.value = "red")
```

COLOR AND FILL SCALES (CONTINUOUS)

```
o + c + geom_dotplot(aes(fill = ..x..))
o + scale_fill_distiller(palette = "Blues")
o + scale_fill_gradient(low = "red", high = "yellow")
o + scale_fill_gradient2(low = "red", high = "blue",
mid = "white", midpoint = 25)
o + scale_fill_gradientn(colors = topo.colors(6))
Also: rainbow(), heat.colors(), terrain.colors(),
cm.colors(), RColorBrewer::brewer.pal()
```

SHAPE AND SIZE SCALES

```
p + e + geom_point(aes(shape = fl, size = cyl))
p + scale_shape() + scale_size()
p + scale_shape_manual(values = c(3:7))
p + scale_size_manual(values = c(1:5))
p + scale_size_area(max_size = 6)
```

Coordinate Systems

```
r <- d + geom_bar()
r + coord_cartesian(xlim = c(0, 5)) - xlim, ylim
The default cartesian coordinate system.
r + coord_fixed(ratio = 1/2)
ratio, xlim, ylim - Cartesian coordinates with
fixed aspect ratio between x and y units.
ggplot(mpg, aes(y = fl)) + geom_bar()
Flip cartesian coordinates by switching x
and y aesthetic mappings.
r + coord_polar(theta = "x", direction = 1)
theta, start, direction - Polar coordinates.
r + coord_trans(y = "sqrt") - x, y, xlim, ylim
Transformed cartesian coordinates. Set xtrans
and ytrans to the name of a window function.
p + coord_quickmap()
values = c("skyblue", "royalblue", "blue", "navy"),
limits = c("d", "e", "p", "r"), breaks = c("d", "e", "p", "r"),
name = "fuel", labels = c("D", "E", "P", "R")
Map projections from the mapproj package
(mercator (default), azequalarea, lagrange, etc.).
```

Position Adjustments

Position adjustments determine how to arrange geoms that would otherwise occupy the same space.

```
s <- ggplot(mpg, aes(fl, fill = drv))
s + geom_bar(position = "dodge")
Arrange elements side by side.
s + geom_bar(position = "fill")
Stack elements on top of one
another, normalize height.
e + geom_point(position = "jitter")
Add random noise to X and Y position of
each element to avoid overlapping.
e + geom_label(position = "nudge")
Nudge labels away from points.
s + geom_bar(position = "stack")
Stack elements on top of one another.
```

Each position adjustment can be recast as a function with manual width and height arguments:
`s + geom_bar(position = position_dodge(width = 1))`

Themes

```
r + theme_bw()
White background
with grid lines.
r + theme_classic()
r + theme_light()
r + theme_gray()
Grey background
(default theme).
r + theme_minimal()
Minimal theme.
r + theme_void()
Empty theme.
r + theme()
Customize aspects of the theme such
as axis, legend, panel, and facet properties.
r + ggtitle("Title") + theme(plot.title.position = "plot")
r + theme(panel.background = element_rect(fill = "blue"))
```

Faceting

Facets divide a plot into subplots based on the values of one or more discrete variables.

```
t <- ggplot(mpg, aes(cty, hwy)) + geom_point()
t + facet_grid(cols = vars(fl))
Facet into columns based on year.
t + facet_grid(rows = vars(year))
Facet into rows based on year.
t + facet_grid(rows = vars(year), cols = vars(fl))
Facet into both rows and columns.
t + facet_wrap(vars(fl))
Wrap facets into a rectangular layout.
```

Set scales to let axis limits vary across facets.

```
t + facet_grid(rows = vars(drv), labeller = label_both,
scales = "free")
x and y axis limits adjust to individual facets:
"free_x" - x axis limits adjust
"free_y" - y axis limits adjust
```

Set labeller to adjust facet label:

```
t + facet_grid(cols = vars(fl), labeller = label_both)
t + facet_grid(rows = vars(fl),
labeller = label_bquote(alpha ^ (fl)))
```

Labels and Legends

Use `labs()` to label the elements of your plot.

```
t + labs(x = "New x axis label", y = "New y axis label",
title = "Add a title above the plot",
subtitle = "Add a subtitle below title",
caption = "Add a caption below plot",
alt = "Add alt text to the plot",
aes = "New <AES> legend title")
```

`t + annotate(geom = "text", x = 8, y = 9, label = "A")`
Places a geom with manually selected aesthetics.

`p + guides(x = guide_axis(n.dodge = 2))` Avoid crowded or overlapping labels with `guide_axis(n.dodge or angle)`.

`n + guides(fill = "none")` Set legend type for each aesthetic: colorbar, legend, or none (no legend).

`n + theme(legend.position = "bottom")`
Place legend at "bottom", "top", "left", or "right".

`n + scale_fill_discrete(name = "Title", labels = c("A", "B", "C", "D", "E"))`
Set legend title and labels with a scale function.

Zooming

```
Without clipping (preferred):
t + coord_cartesian(xlim = c(0, 100), ylim = c(10, 20))
With clipping (removes unseen data points):
t + xlim(0, 100) + ylim(10, 20)
t + scale_x_continuous(limits = c(0, 100)) +
scale_y_continuous(limits = c(0, 100))
```

3.2 Frequency over time - epidemic curves

one of the most common, and important portrayals of animal (all) health data

CDC: <https://stacks.cdc.gov/view/cdc/11425>

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

Task: lets redo those Epidemic curve graphs but focusing on FMD - but do this without changing the underlying data, just use the ggplot language

Can you go one step further and just look at 2014 and 2015?
– for this you might want to change the underlying data

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

Table 1
Variables associated with animal-level seroprevalence of FMD based on univariable logistic regression with random effect for herd ID.

Variable and category	No. tested (n)	FMD		
		% NSP prevalence (95 % CI)	Odds ratio (95 % CI)	P-value
Sex				
Male	250	76.0 (70.1–81.8)	1 (Ref.)	
Female	920	86.0 (83.5–88.4)	2.9 (1.8–4.7)	< 0.001
Zones*				
Zone 3	240	63.3 (57.5–69.9)	1 (Ref.)	
Zone 2	465	83.4 (79.7–87.2)	3.6 (2.2–5.9)	< 0.001
Zone 1	465	94.8 (92.6–97.0)	14.7 (7.8–27.7)	< 0.001

Interpret regression coefficients

- Categorical (as in our example)
 - Accounting for other variables in the model (not what they have presented but relevant), the odds of female animals being sero-positive for FMD were 2.9 times higher when compared to male animals
 - Odds ratio without accounting for other variables in this case is 1.93 (we will perform this in R – in a 2X2 table the $OR = AD/BC$)

Sex					
Male	250	76.0 (70.1–81.8)	1 (Ref.)		
Female	920	86.0 (83.5–88.4)	2.9 (1.8–4.7)		< 0.001
Zones*					
Zone 3	240	63.3 (57.5–69.9)	1 (Ref.)		
Zone 2	465	83.4 (79.7–87.2)	3.6 (2.2–5.9)		< 0.001
Zone 1	465	94.8 (92.6–97.0)	14.7 (7.8–27.7)		< 0.001

Fixed and Random effects

Fixed effects are variables that are constant across individuals; these variables, like age, sex, or ethnicity, don't change or change at a constant rate over time

Random effects are those variables where there may be variance in outcomes based on groupings – commonly in Veterinary Epidemiology it may be as a result of herds.

- Like ICC – it is a way of accounting for uncertainty of within herd variance
- $glmer(fmd_exp_st \sim anim_sex + (1|hse_id))$

4.2 Perform univariable logistic regression accounting for Herd as a Fixed effect for two of the other variables in the Nthiwa et al. dataset

Ministry of Trade &
Industry

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

4.3 A chi-square (χ^2) statistic

is a measure of the difference between the observed and expected frequencies of the outcomes of a set of events or variables

Typically used when you have a X by 2 setup

Use fishers exact test when any value in the table is 5 or below

4.4 Multivariate analysis

- Accounting for other variables in the data
- Notice the impact on the sex variable – shows the impact that considering other variables has

Table 3

Final multivariable model of animal-level risk factors for FMD in cattle based on GLMM analysis with a random effect for herd ID.

Variables	Category	Odds ratio (95 % CI)	P-value
Fixed effects			
Animal sex	Male	1 (Ref.)	
	Female	4.0 (2.5–6.4)	< 0.001
Study zones*	Zone 3	1 (Ref.)	
	Zone 2	3.2 (1.9–5.5)	< 0.001
	Zone 1	6.6 (2.2–19.6)	0.001
Contact with cattle (from a different herd) at watering points	No	1 (Ref.)	
	Yes	1.7 (1.0–2.8)	0.045
Herd management practice	Sedentary	1 (Ref.)	
	Pastoral	2.6 (1.0–6.8)	0.049

R Markdown Cheat Sheet

learn more at rmarkdown.rstudio.com

rmarkdown 0.2.50 Updated: 8/14

1. Workflow R Markdown is a format for writing reproducible, dynamic reports with R. Use it to embed R code and results into slideshows, pdfs, html documents, Word files and more. To make a report:

i. **Open** - Open a file that uses the .Rmd extension.

ii. **Write** - Write content with the easy to use R Markdown syntax

iii. **Embed** - Embed R code that creates output to include in the report

iv. **Render** - Replace R code with its output and transform the report into a slideshow, pdf, html or ms Word file.

2. Open File Start by saving a text file with the extension .Rmd, or open an RStudio Rmd template

- In the menu bar, click **File > New File > R Markdown...**
- A window will open. Select the class of output you would like to make with your .Rmd file
- Select the specific type of output to make with the radio buttons (you can change this later)
- Click OK

3. Markdown Next, write your report in plain text. Use markdown syntax to describe how to format text in the final report.

syntax

Plain text
End a line with two spaces to start a new paragraph.
italics and *_italics_*
****bold**** and **__bold__**
^{superscript}
~~strikethrough~~

- ordered list
- item 2
 - sub-item 1
 - sub-item 2

Table Header	Second Header
Table Cell	Cell 2
Cell 3	Cell 4

4. Choose Output Write a YAML header that explains what type of document to build from your R Markdown file.

YAML

A YAML header is a set of key: value pairs at the start of your file. Begin and end the header with a line of three dashes (---)

```
---
title: "Untitled"
author: "Anonymous"
output: html_document
---

This is the start of my
report. The above is metadata
saved in a YAML header.
```

The RStudio template writes the YAML header for you

The output value determines which type of file R will build from your .Rmd file (in Step 6)

output: html_document html file (web page)
output: pdf_document pdf document
output: word_document Microsoft Word .docx
output: beamer_presentation beamer slideshow (pdf)
output: ioslides_presentation ioslides slideshow (html)

EU-SADC Economic Partnership Agreement (EPA) Implementation Support Programme in Botswana

Boosting Botswana's Trade Capacity

5. Embed Code Use knitr syntax to embed R code into your report. R will run the code and include the results when you render your report.

inline code

Surround code with back ticks and `r`.
R replaces inline code with its results.

Two plus two equals `r 2 + 2`.
Two plus two equals 4.

code chunks

Start a chunk with `{r}`.
End a chunk with `}`.

Here's some code
`{r}`
`dim(iris)`
Here's some code
[1] 150 5

display options

Use knitr options to style the output of a chunk.
Place options in brackets above the chunk.

Here's some code
`{r eval=FALSE}`
`dim(iris)`
Here's some code
`{r echo=FALSE}`
`dim(iris)`
Here's some code
[1] 150 5

option	default	effect
eval	TRUE	Whether to evaluate the code and include its results
echo	TRUE	Whether to display code along with its results
warning	TRUE	Whether to display warnings
error	FALSE	Whether to display errors
message	TRUE	Whether to display messages
tidy	FALSE	Whether to reformat code in a tidy way when displaying it
results	"markup"	"markup", "asis", "hold", or "hide"
cache	FALSE	Whether to cache results for future renders
comment	"##"	Comment character to preface results with
fig.width	7	Width in inches for plots created in chunk
fig.height	7	Height in inches for plots created in chunk

For more details visit yihui.name/knitr/

6. Render Use your .Rmd file as a blueprint to build a finished report.

Render your report in one of two ways

1. Run `rmarkdown::render("<file path>")`
2. Click the **knit HTML** button at the top of the RStudio scripts pane

When you render, R will

- execute each embedded code chunk and insert the results into your report
- build a new version of your report in the output file type
- open a preview of the output file in the viewer pane
- save the output file in your working directory

7. Interactive Docs Turn your report into an interactive Shiny document in 3 steps

1 Add runtime: shiny to the YAML header

```
title: "Line graph"
output: html_document
runtime: shiny
```

2 In the code chunks, add Shiny input functions to embed widgets. Add Shiny render functions to embed reactive output

```
title: "Line graph"
output: html_document
runtime: shiny

Choose a time series:
{r echo = FALSE}
selectInput("data", "",
  c("co2", "lh"))

See a plot:
{r echo = FALSE}
renderPlot({
  d <- get(input$data)
  plot(d)
})
```

3 Render with **rmarkdown::run** or click **Run Document** in RStudio

* Note: your report will be a Shiny app, which means you must choose an html output format, like `html_document` (for an interactive report) or `ioslides_presentation` (for an interactive slideshow).

8. Publish Share your report where users can visit it online

Rpubs.com

Share non-interactive documents on RStudio's free R Markdown publishing site
www.rpubs.com

ShinyApps.io

Host an interactive document on RStudio's server. Free and paid options
www.shinyapps.io

Click the "Publish" button in the RStudio preview window to publish to rpubs.com with one click.

Theme 7: Further analysis of diagnostic tests

Diagnostic test evaluation is a complex topic.

- Typical issues with non-gold standards
- Where gold standards exist then analysis is manageable and pretty much descriptive as sensitivity, specificity and other test characteristics
- We have looked at interpreting diagnostic tests in parallel and an series
- To further our knowledge we will consider the
 - Kappa statistic
 - Descriptive stats on Ct values

KAPPA statistic

- Kappa is a measure of agreement beyond the level of agreement expected by chance alone. The observed agreement is the proportion of samples for which both methods (or observers) agree (see ?epiR::epi.kappa)
- Can be used to evaluate an opinion as well as a diagnostic test
- Flip coin by two different people and establish Kappa
